

RERC 2014 – 16.06.2014 - Oslo

HYDROGEN FOR RENEWABLE ENERGY STORAGE: DEVELOPMENT OF PEM WATER ELECTROLYSERS

Magnus Thomassen, Tommy Mokkelbost
SINTEF Materials and Chemistry

Background

- Political (and public) pull for increased use of renewable energy sources
- >27% renewables in EU by 2030
- 40% renewables in Germany by 2020, 80% by 2050.

Presentation of J.M. Barroso to the European Council, 20-21 March 2014

Germany's plan: switch from coal and nuclear to renewables

Water electrolysis – technological status

- The Dutch merchant van Trostwijk and medical doctor Deiman observed the decomposition of water into "combustible air" and "life giving air" in 1789.
- In 1800 Alessandro Volta published the invention of the voltaic pile (see original sketch)
- J. W. Ritter, W. Nicholson and A. Carlisle demonstrated "water electrolysis" only months after

Test set-up of Ritter

Water electrolysis – technological status

- Production of hydrogen by water electrolysis
 - 1-2 % of total hydrogen production in the world
 - Onsite production, from very small to large scale
 - Very pure hydrogen
- Applications
 - Food industry
 - Metallurgical industry and metal works
 - Semiconductor production
 - Chemical and petrochemical industry
 - Meteorological balloons
 - Research labs

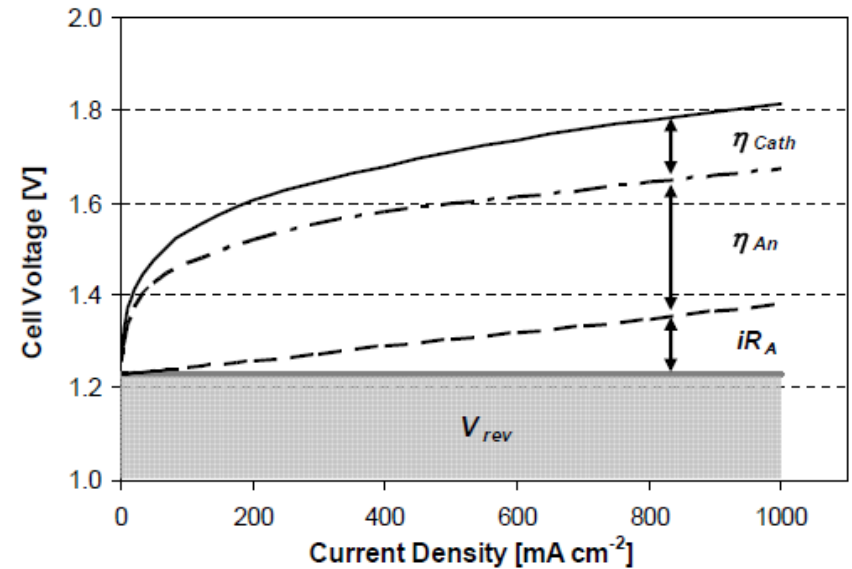

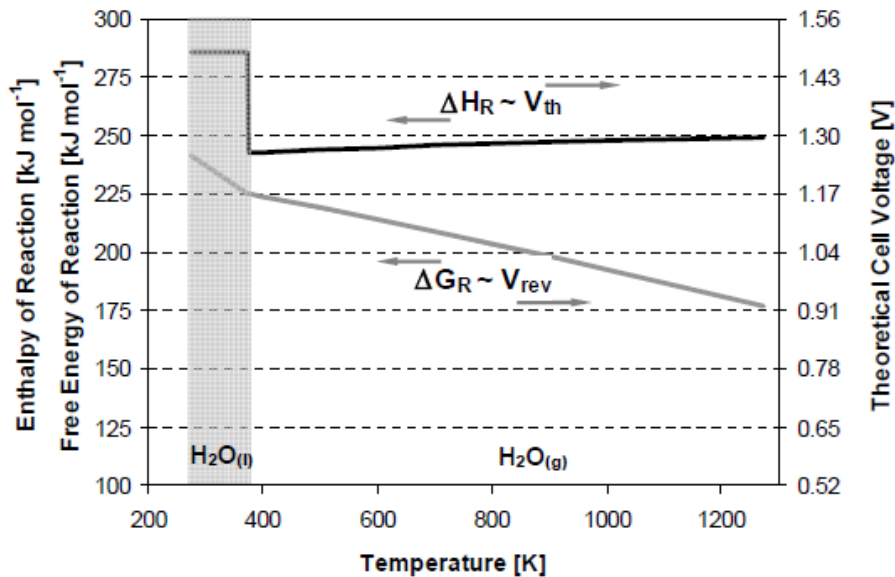

Industrial application	Typical size electrolyser
Jewellery, laboratory and medical engineering	5 - 500 NI/h
Generator cooling in power plants	5 - 20 Nm ³ /h
Feed Water Inertisation (BWR water chemistry)	10 - 50 Nm ³ /h
Float glas production (protective atmosphere)	50 - 150 Nm ³ /h
Electronics industry	100 - 400 Nm ³ /h
Metallurgy	200 - 750 Nm ³ /h
Food industry (fat hardening)	100 - 900 Nm ³ /h

Approaches for water electrolysis

Technology	Temp. Range	Cathodic Reaction (HER)	Charge Carrier	Anodic Reaction (OER)
Alkaline electrolysis	40 - 90 °C	$2H_2O + 2e^- \Rightarrow H_2 + 2OH^-$	OH^-	$2OH^- \Rightarrow \frac{1}{2}O_2 + H_2O + 2e^-$
Membrane electrolysis	20 - 100 °C	$2H^+ + 2e^- \Rightarrow H_2$	H^+	$H_2O \Rightarrow \frac{1}{2}O_2 + 2H^+ + 2e^-$
High temp. electrolysis	700 - 1000 °C	$H_2O + 2e^- \Rightarrow H_2 + O^{2-}$	O^{2-}	$O^{2-} \Rightarrow \frac{1}{2}O_2 + 2e^-$

Efficiency of water electrolysis

- Thermodynamics

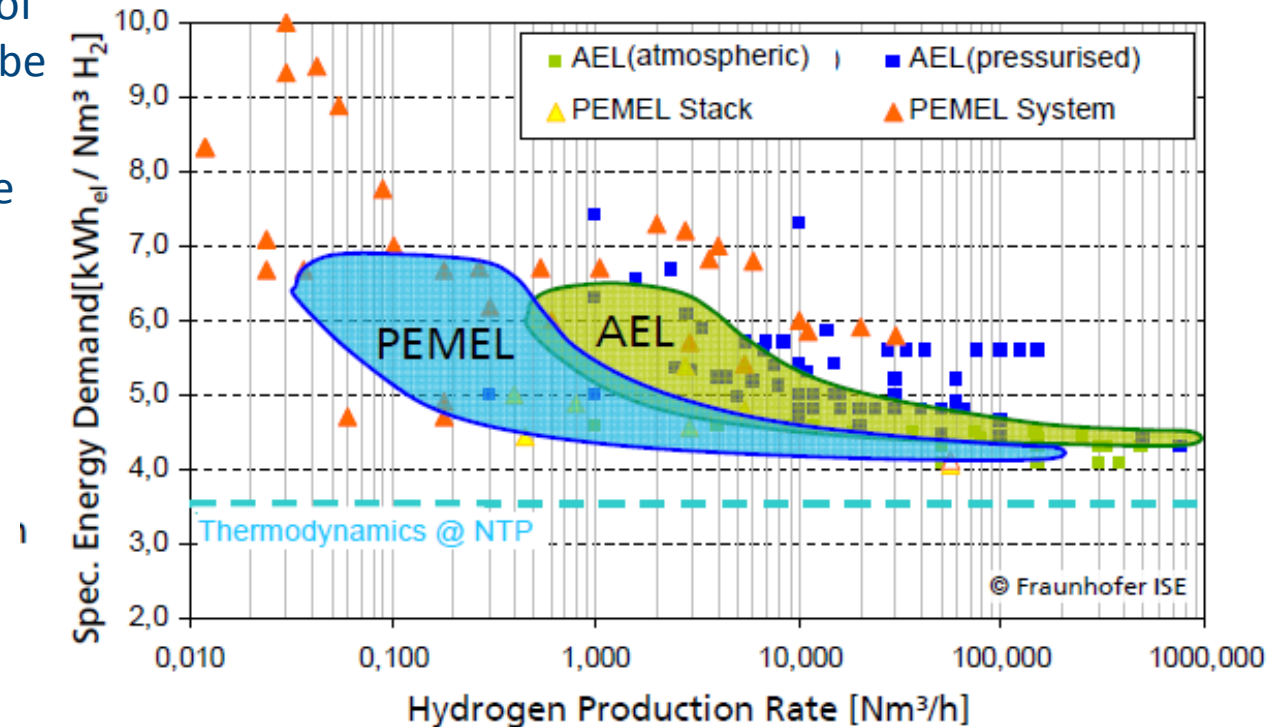

- Reversible losses
- HHV: 3.54 kWh/ $\text{Nm}^3 \text{H}_2$
- Endothermal reaction

- Reaction kinetics

- Irreversible losses
- Overpotentials and internal resistance

Performance and efficiencies of water electrolysis

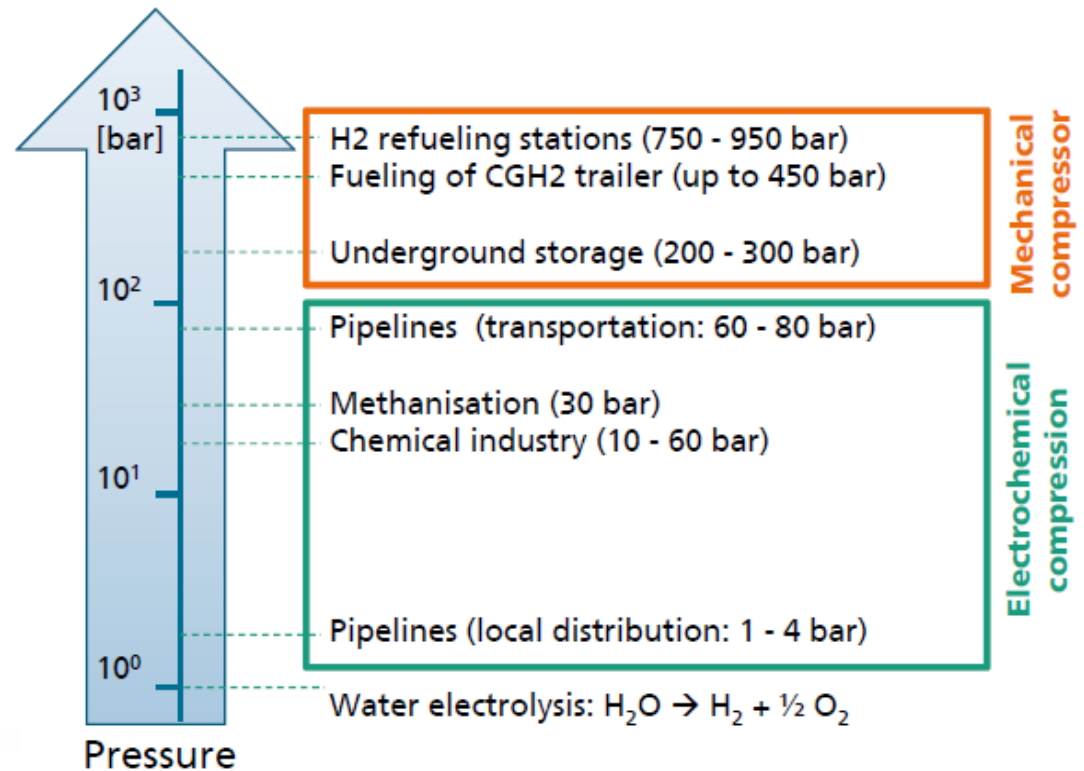

- No significant reduction of energy consumption can be expected
- Higher operating pressure
- Higher power density
- Dynamic operation

Pressurized electrolysers

- Pressurized hydrogen is needed for almost all applications
- Electrochemical compression more efficient than mechanical
- Mechanical compressors needed for high pressure applications

Pressure [bar]	AEL	PEMEL	HTEL
Typically	4 - 15	30	Atm.
Available	60	207	(Atm.)
Demonstrated	~ 345	~ 400	(10)

Dynamic operation

- PEM electrolyzers capable of sub second regulation
- Alkaline electrolyzers somewhat more sluggish
- High Temperature electrolyzers need more stable operation

- Significant capacity for dynamic load management

PEM Electrolyzer Operation as Control Power Unit

SIEMENS

- startup time (black start) ~ 10 min
- from standby to full load in < 10 sec
- full dynamic behavior (positive, negative or combined mode control power)

PEM electrolyzers can be operated as efficient dynamic load for secondary and even primary control power

Hydrogen from renewables - economy

Fuel cells and hydrogen

Target setting – Carbon price to achieve parity with counterfactuals

Germany, 2030

Alkaline and PEM Water Electrolysers – Grid Connected

CO₂ price required to compete (€/t CO₂)

- Alkaline - Best case
- Alkaline - Central case
- PEM - Best case
- PEM - Central case

SINTEF activities on PEM electrolysers

Cost reduction and efficiency improvement

NEXPEL Projected stack cost

FCH-JU 2025
target
350 €/kW

DOE 2015 target
225 €/kW

- Power supplies
- Balance of plant
- MEA
- flow fields and separators
- balance of cell
- balance of stack

SINTEF activities on PEM electrolysers

NEXPEL main objective:

Develop and demonstrate a PEM water electrolyser integrated with RES:
75% Efficiency (LHV), H₂ production cost - €5,000 / Nm³h⁻¹, target lifetime of 40,000 h

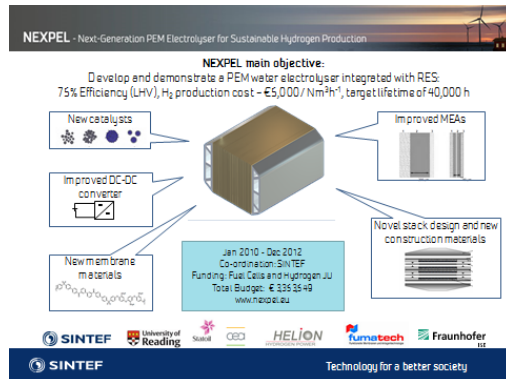

Technology for a better society

SINTEF activities on PEM electrolyzers

- Coordinator of two FP7 (FCH-JU) projects on materials development for PEM electrolyzers
- FCH-JU project under negotiations
- MW scale up

The next step; NOVEL

- Continuation of novel materials development
 - New catalysts and catalyst supports
 - Radiation grafted membranes
 - Coatings of bipolar plates and current collectors
- System design and optimization
- Increased understanding of life cycle and degradation aspects of PEM electrolyzers

SINTEF activities on PEM electrolysers

Advanced oxygen evolution catalysts

- Increase catalytic activity and stability of O₂ evolution catalysts by utilization of a support
 - Increase active surface area
 - Increase catalyst utilization
 - Reduce catalyst particle sintering by support stabilization
 - Increase specific catalytic activity by catalyst support interaction?

Challenges

- High surface area support
- Stable at elevated voltages and acidic environment for several 1000s hours.

Supported catalyst

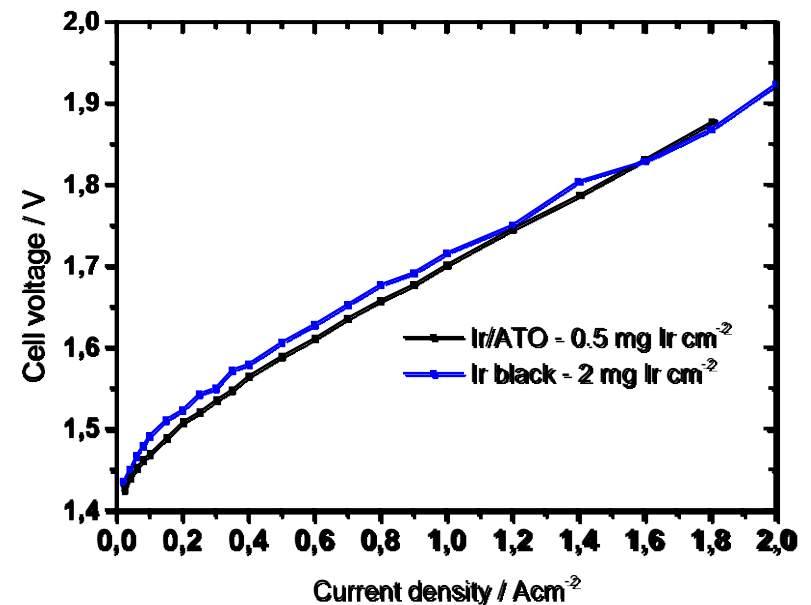

Core-shell structure

SINTEF activities on PEM electrolyzers

Advanced oxygen evolution catalysts

- Iridium nanoparticles ($d \sim 2\text{-}4\text{ nm}$)
 - Antimony doped Tin Oxide as support
 - Noble metal loading of 20 wt%
-
- 300% higher catalytic activity than state of the art OER catalysts

SINTEF activities on PEM electrolyzers

Other ongoing activities

- Development of new conductive oxides
 - Catalyst supports and coatings
- Advanced catalysts
 - Trimetallic alloys for supported catalysts
- Coatings for replacement of Ti as bipolar plates
- Studies of lifetime and degradation

SINTEF activities on High Temperature electrolysers

- NFR ENERGIX METALLICA project (coordinator: SINTEF, Partner: UiO) (2013-2017)

The primary objective is to develop a robust steam electrolysis technology for H₂ production based on novel **planar** alloy supported proton conducting electrolysers (PCEC) operating at 600°C for efficient use of heat and steam supplied by geothermal and solar plants. Proof-of-concept of CO₂ and steam co-electrolysis will also be demonstrated for potential integration of PCEC in industrial processes.

- FCH ELECTRA project (coordinator: UiO, Partners: PROTIA, CSIC; SINTEF, Carbon Recycling International, Abengoa Hidrogeno , Marion Technolgies) (2014-2018)

The main goal of ELECTRA is to design, build, and test a kW size **multi-tubular** proton ceramic high temperature electrolyser for production of hydrogen from steam and renewable energy.

Thank you for your attention
